

APPLICATION WORKFLOW DOCUMENT

Garment Production Tracker

Version 2.0

This document traces the complete journey of a single garment order — from client PO to payment closure. Each step maps to a specific actor, UI action, and backend event in Supabase.

Overview

The workflow is divided into four phases. Each phase maps to a set of Supabase database writes, RLS-gated reads, and optional Edge Function calls. The yellow rows below each step describe the backend operation that occurs.

Offline note: Steps performed by floor staff (Phases 2 & 3) are written to localStorage first, then synced to Supabase when the device reconnects. The UI shows a pending indicator until the sync is confirmed.

1

Planning & Setup

#	Actor	Action
1	Client	Places an order with the factory (external — no system action).
2	Production Planner	Logs into the web portal and creates a new PO: enters customer name, SKUs, sizes, quantities, and target delivery date.
		<i>Supabase: INSERT into purchase_orders; status = 'draft'</i>
3	System (Edge Fn)	Automatically calculates the Bill of Materials — order_qty * material_per_item for each fabric and trim.
		<i>Supabase: Edge Function: calculate_bom() → INSERT into bom_items</i>
4	System	Checks BOM totals against inventory table. If any material is short, flags a Purchase Request. If all available, moves PO to 'In Production'.
		<i>Supabase: SELECT from inventory; UPDATE purchase_orders.status = 'in_production' or 'pending_stock'</i>

2

Pre-Production & Store

#	Actor	Action
5	Store Manager	Opens the mobile job queue, sees the pending PO, and taps 'Release Material'. Stock is deducted from inventory.
		<i>Supabase: UPDATE inventory (deduct quantities); INSERT production_stages (stage = 'material_released')</i>
6	Cutting Master	Sees the order appear in their mobile queue. Performs the cutting work, then taps 'Cutting Complete'.
		<i>Supabase: INSERT production_stages (stage = 'cutting_complete', timestamp = now())</i>

3

The Stitching Floor — Mobile Tracking

#	Actor	Action
7	System	A digital Job Card (the PO profile) becomes visible in all floor supervisors' queues, showing current stage and remaining steps.
8	Production Supervisor	Taps stage buttons as physical work is completed. Each tap updates the Job Card in real time via Supabase Realtime.
	<i>Supabase: INSERT production_stages for each stage; Realtime broadcasts to all connected clients</i>	
9	Production Supervisor	After ironing, opens the QC form and marks Pass or Fail. If Pass: PO moves to Packing. If Fail: rework note is required and PO returns to Stitching.
	<i>Supabase: UPDATE purchase_orders.status = 'packing' or 'rework'; INSERT qc_inspections record</i>	

QC Pass path

Order moves directly to Packing queue. Accounts Manager is able to generate documents.

QC Fail path

Rework note is mandatory. Order returns to Stitching stage. Supervisor re-taps through the stages.

4 Dispatch & Finance

#	Actor	Action
10	Accounts Manager	Logs into the web portal, verifies the packed quantity on the PO, and clicks 'Generate Documents'.
	<i>Supabase: Edge Function: generate_pdf() → saves challan PDF to Supabase Storage; returns public URL</i>	
11	Accounts Manager	Enters the delivery agency name and tracking number into the PO record.
	<i>Supabase: UPDATE purchase_orders (courier_name, tracking_number)</i>	
12	Delivery Person / Coordinator	Uploads a photo of the signed delivery receipt via the mobile interface.
	<i>Supabase: Upload to Supabase Storage (delivery_proofs bucket); INSERT delivery_proofs record</i>	
13	Accounts Manager	Logs the payment amount received in the payment ledger. When the full amount is recorded, marks the PO as 'Closed'.
	<i>Supabase: INSERT payments record; UPDATE purchase_orders.status = 'closed'; order is archived from active views</i>
